

Applied Modeling in Pharmaceutical Engineering

Description

In the pharmaceutical industry, accurate process models are essential for advanced control, process development, and maintaining high-quality standards. However, modeling pharmaceutical flow reactor systems poses significant challenges. The industry is therefore increasingly focusing on various tools and methodologies for effective modeling.

The **objective of this Bachelor project is to evaluate different modeling approaches to enhance the automation and optimization of chemical processes.** These modeling techniques will be **tested using real experimental data and cutting-edge industrial software solutions.**

Objectives

- Conduct a **literature review on modeling** concepts utilized in Pharmaceutical Engineering
- **Compare, select, implement,** and test different modeling approaches
- **Validate and compare** the modeling approaches using **real laboratory setups** and/or **actual experimental data**
